"Every Cookie Tells A Sweet Story"

GITHUB & VS CODE TEAM COLLABORATION GUIDE

Step-by-Step Beginner Manual for 4-Developer Parallel Vibe Coding

Target Audience:	Meethi Kahani Frontend & Backend Development Team (4 Members)
Prerequisite Level:	Absolute Beginners (Zero prior Git / GitHub experience required)
Primary Tooling:	GitHub.com + GitHub Desktop App / VS Code Git Extension + Terminal
Core Goal:	Parallel Vibe Coding without code overwrites or merge conflicts
Document Version:	Version 1.0 Team Master Guide
Date of Issue:	August 2026

WELCOME TEAM!

If you have never used GitHub before, do not worry! This guide breaks down GitHub collaboration into simple, non-technical steps. By following our **Modular Folder System** and **5 Daily Git Steps**, all 4 of us can write code simultaneously without breaking anyone else's work.

1. What is GitHub & The 4-Developer Golden Rule

Think of **GitHub** as Google Drive for code. Instead of emailing zip files back and forth, GitHub maintains a central copy of the project in the cloud (`main` branch) and allows each developer to work on their own copy (`feature branch`).

The Golden Rule of Modular Work:

To guarantee zero code conflicts, every developer works strictly inside their assigned folder under `src/modules/`. **Never edit files in another teammate's folder!**

Developer	Assigned Module & Path	Responsibilities & Scope
Developer 1	`src/modules/HeaderNav/` `src/modules/HeroBanner/`	Header Logo, Hamburger Drawer, Cart & Account triggers, Hero Carousel, Freshness Ticker.
Developer 2	`src/modules/ProductCatalog/`	Category Filter Tabs, Cookie Cards, PDP Page (`/product/:slug`), 'The Kahani' story modal.
Developer 3	`src/modules/CartPayment/` `src/modules/CustomerPortal/`	Slide-Over Cart Drawer, Cookie Crumb Bar, Pincode Checker, Dummy Razorpay Modal, Customer Account & Reviews.
Developer 4	`src/modules/AdminPortal/` `src/modules/SellerPortal/`	Super Admin Dashboard (`/admin`), Banner Editor, Coupons, Invoice Generator, Seller Kitchen Queue (`/seller`).

2. Initial 1-Time Setup (First Time Only)

Step 2.1: Create a Free GitHub Account

Go to <https://github.com> and sign up for a free account. Send your GitHub username to the Team Lead.

Step 2.2: Install Git & GitHub Desktop (Easiest GUI)

- Download Git: <https://git-scm.com/downloads>
- Download GitHub Desktop App (Recommended for Beginners): <https://desktop.github.com>

Step 2.3: Clone the Repository to Your Computer

Open **GitHub Desktop** -> Click *File* -> *Clone Repository* -> Select **MeethiKahaniV1** -> Click **Clone**.

Or using Terminal:

```
git clone https://github.com/YourUsername/MeethiKahaniV1.git
```

3. The 5 Daily Magic Steps for Every Developer

Follow these 5 steps every time you sit down to code:

STEP 1: Start of Day — Pull Latest Code from Main

Before writing any code, fetch the latest code updated by your teammates:

```
git checkout main git pull origin main
```

STEP 2: Create Your Own Work Branch

Never code on `main`. Create your personal feature branch (e.g. `dev1-header`):

```
git checkout -b dev1-header
```

STEP 3: Write Your Code Inside Your Assigned Folder

Open VS Code and write your React components inside your assigned module folder (e.g. `src/modules/HeaderNav/`). Save your files (Ctrl + S).

STEP 4: Save & Commit Your Work Locally

Bundle your changes into a commit with a clear message:

```
git add . git commit -m "Added header centered logo and cart icon"
```

STEP 5: Push Your Branch to GitHub

Upload your branch to GitHub in the cloud:

```
git push origin dev1-header
```

4. How to Merge Code (Pull Requests / PR)

After you push your branch to GitHub, your code needs to be merged into the main project.

Step #	Action on GitHub.com	What Happens
Step 1	Go to GitHub Repository in Web Browser	You will see a green banner: <i>'dev1-header had recent pushes 1 minute ago'.</i>
Step 2	Click 'Compare & Pull Request'	Opens the Pull Request submission form.
Step 3	Add Title & Click 'Create Pull Request'	Notifies Team Lead that your module is ready for review.
Step 4	Team Lead Clicks 'Merge Pull Request'	Your code is instantly combined into the main project!

5. Zero-Command GUI Method (GitHub Desktop App)

If typing terminal commands feels scary, you can do EVERYTHING using 3 buttons in the **GitHub Desktop App**:

- **Button 1: 'Current Branch' (Top Left)** -> Click to create or switch to your branch (`dev1-header`).
- **Button 2: 'Commit to dev1-header' (Bottom Left)** -> Type a short summary of changes and click Commit.
- **Button 3: 'Push Origin' (Top Right)** -> Click to send code to GitHub in 1 click!

6. Troubleshooting & Emergency Rules

Q1: What if Git shows a 'Merge Conflict'?

Do not panic! Merge conflicts only happen if 2 people edit the exact same line of code in the exact same file. Because everyone works inside their own `src/modules/DevFolder`, conflicts will almost never happen.

Q2: What if I break my local code?

You can discard your unsaved changes and restore clean code anytime:

```
git checkout -- .
```

Q3: How do I get my teammates' newly merged code?

Switch to main, pull updates, and merge main into your branch:

```
git checkout main git pull origin main git checkout dev1-header git merge main
```
